a person's skin color affects their life experiences including income educational attainment health outcomes exposure to discrimination interactions with the criminal justice system and one's sense of ethnoracial group belonging but do these disparate experiences affect the relationship between skin color and political views in skin color power and politics in america political scientists mara ostfeld and nicole yadon explore the relationship between skin color and political views in the u s among latino black and white americans they examine how skin color influences an individual's politics and

whether a person's political views influence how they assess their own skin color. Ostfeld and Yadon surveyed over 1,300 people about their political views including party affiliation, their opinions on welfare and the importance of speaking English in the U.S. The authors created a matrix grounded in their roots of race framework which predicts the relationship between skin color and political attitudes for each ethnoracial group based on the blurriness of the group's boundaries and historical levels of privilege they draw upon three distinct measures of skin color to conceptualize the relationship between skin color and political views. Machine rated skin color measured with a light reflectance meter, self-assessed skin color using the Yadon-Ostfeld skin color scale, and skin color discrepancy—the difference between one's machine rated and self-assessed skin color. Ostfeld and Yadon examine patterns that emerge among these measures and their relationships with life experiences and political stances among Latinos, a group with relatively blurry group boundaries and low levels of historical privilege. The authors find a robust relationship between political views and self-assessed skin color. Latinos who overestimate the lightness of their skin color are more likely to hold conservative views on current racialized political issues such as policing. Latinos who overestimate the darkness of their skin color, on the other hand, are more likely to hold liberal political views as America's major political parties remain divided on issues of race. This suggests that for Latinos self-reported skin color is used as a means of aligning oneself with valued political coalitions. African Americans, another group with low levels of historical privilege but with more clearly defined group boundaries, demonstrated no significant relationship between skin color and political attitudes. Thus, the lived experiences associated with being African American appeared to supersede the differences in life experiences due to skin color. Whites, a group with more historical privilege and increasingly blurry group boundaries, showed a clear relationship between machine-assessed skin color and attitudes on political issues: those with darker machine-rated skin color are more likely to hold conservative views suggesting that they are responding to the threat of losing their privilege in a multicultural society at a time when the U.S. is both more diverse and politically divided. Skin color, power, and politics in America is a timely account of the ways in which skin color and politics are intertwined.

Art and science work is experiencing a dramatic rise coincident with burgeoning science and technology studies (STS) interest in this area. Science has played the role of muse for the arts, inspiring imaginative reconfigurations of scientific themes and exploring their cultural resonance; conversely, the arts are often deployed in the service of science communication, illustration and popularization. STS scholars have sought to resist the instrumentalization of the arts by the sciences, emphasizing studies of theories and practices across disciplines and the distinctive and complementary contributions of each. The manifestation of this commonality of creative and epistemic practices is the emergence of art, science and technology studies (ASTS) as the interdisciplinary exploration of art, science, and this handbook.
